

ABSTRACT

5 Data pool architecture, system, method and computer program product, for
intelligent object data in heterogeneous data environments. Applications include life
sciences, biotechnology, therapeutic diagnostics and intervention, pharmaceuticals, and
bioinformatics. Intelligent object data structure.. Intelligent molecular objects (IMO)
and data structure include procedural and non-procedural components where non-
procedural component has features in common with conventional data and procedural
10 component couples additional information with data and adds functionality and
capabilities to system or method utilizing it. Applications handling system, architecture, and
framework referred to as the intelligent object handler (IOH). Intelligent object pools (IOP)
which comprise a second database structure in addition to the afore described IMO data
structure.
